

Current balance...

- **Kp Current Balance Compensator**Used to tune current balance loop compensator
- **Ki Current Balance Compensator**Used to tune current balance loop compensator
- **Z1 Current Balance Compensator**Displays the zero location of current balance compensator
- **BW Current Balance Compensator**Displays the bandwidth of current balance compensator

How to tune and how to disable

When tuning make sure the Bandwidth BW is less than the BW for Vout loop. Typical 1/3 of the voltage loop.

Typical start values are Kp=40 Ki=20

To turn off current balancing set Kp=0 and Ki=0
